Term Project- SereniTea

Professor Kang

Strategic Management and Design Thinking

04/23/2025

Introduction

As the world has kept evolving through time, so has society. Society has increasingly become more aware of issues that might have been swept under the rug in years past. As we keep evolving, we keep becoming more aware of issues that might not have been relevant in the past. Over the past decade or so, there has been a significant rise in mental health awareness around the United States. It became even more relevant when Covid-19 became a serious issue that everyone had to suffer through in 2020. With this rise of awareness toward mental health, there has been more of a demand for services that cater toward people with these issues, along with an increased demand for people wanting to be in serene areas. People want to feel welcome wherever they may go to receive a service, and this is where SereniTea can come into play. SereniTea is a coffee shop that specifically caters to the mental health wellness market. SereniTea would be providing a service that isn't being provided at the moment by any large coffee chain. The following sections will be providing insights on the product design, the strategic positioning for the business, along with financial research to back up the business as well.

Product Design

At the beginning of the semester, many ideas were proposed for the term project. Only one thing remained consistent, the need to create a product or service that had mental health at its core. The idea that was settled upon is a coffee shop that specializes itself in the service it provides, which is the ultimate serene experience for the customer. It was clear that mental health awareness was the main selling point of SereniTea, but there wasn't any research to back up the thought process of a wellness centered coffee shop potentially being in demand.

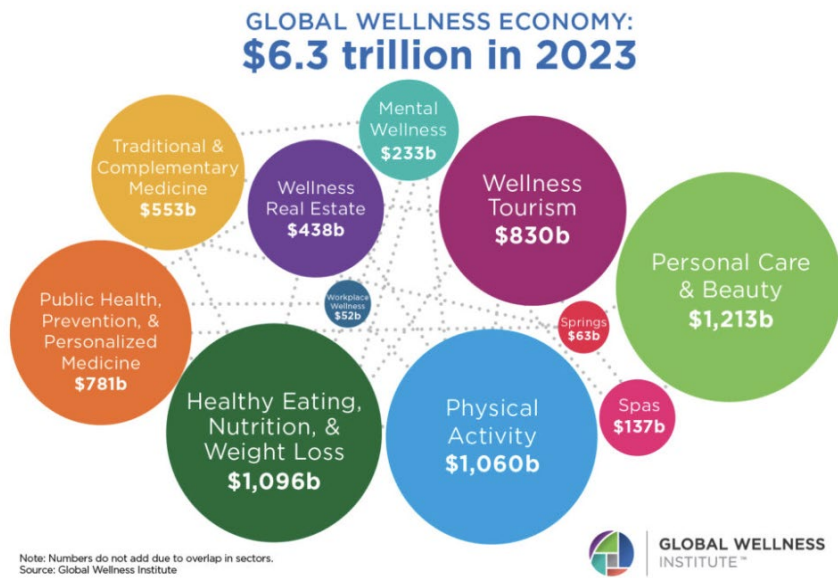

Figure 1.0

Figure 1.0 provided by the Global Wellness Institute, shows that there is a huge global wellness economy around the world at the moment. Relevant data points from the figure include healthy eating and nutrition, wellness real estate, and mental wellness. It is clear from Figure 1.0 that all three areas have a great number of money invested around the world. This validated the idea of using mental wellness as something to base the business around as it is clear there is monetary validation for the niche around the world. The largest piece of the puzzle for SereniTea would be the mental wellness section. The next important section would be healthy eating and nutrition. Both of these are of extreme interest for SereniTea because they are the entire basis around the idea. There were many ideas initially proposed as far as the menu for the cafe. Ideas such as comfort food, juices, and cheap frozen food were on the table at the start of the semester. As the idea evolved, the team realized these types of food and drink did not align with the entire

purpose of SereniTea. Research was done, and the conclusion that resulted was that healthy food and drink was a fundamental necessity for SereniTea. According to a Harvard Health publication by Eva Selhub, “Eating high-quality foods that contain lots of vitamins, minerals, and antioxidants nourishes the brain and protects it from oxidative stress”. This was an important piece of information because it gave us direction for how we should work with our menu and which direction we should pursue. It became clear that the menu for SereniTea should become centered around providing the customers with high quality, nutritional foods and smoothies that will help with their overall well-being. This will include fruit smoothies, acai bowls with fruit, avocado-heavy sandwiches, and much more. After substantial research, the conclusion was that there is overwhelming evidence that there would be plenty of demand for SereniTea.

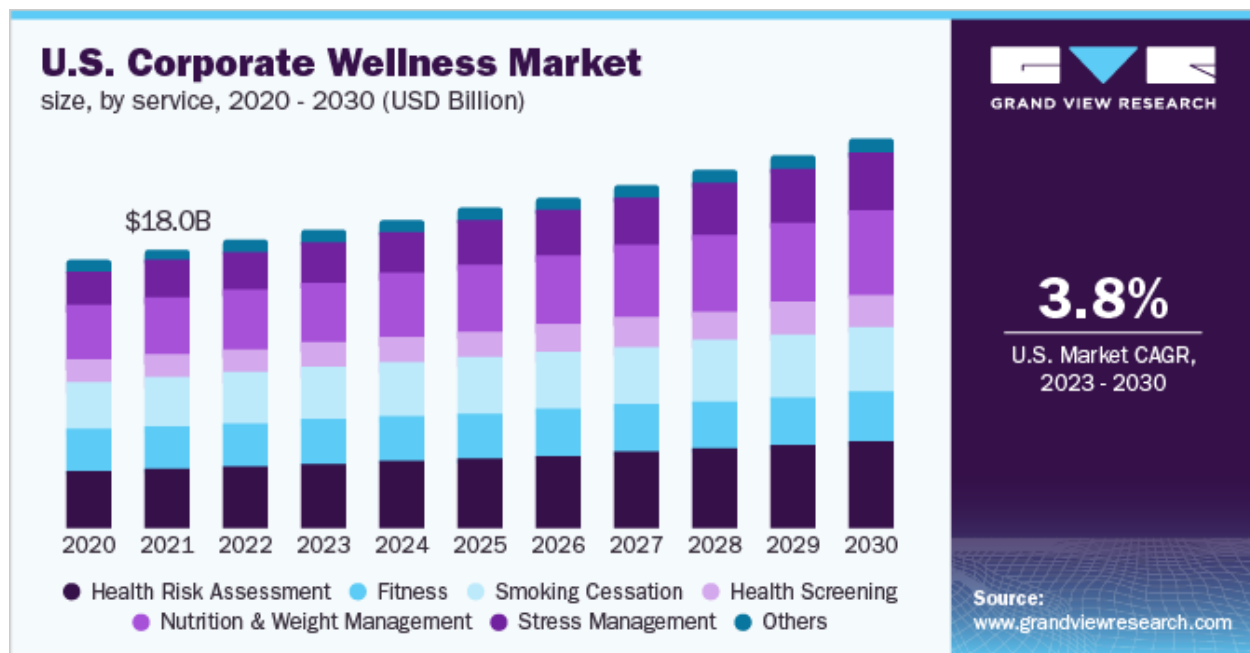

Figure 1.1

Figure 1.1 provides further detail into the wellness market, but narrowed down to the United States. This was further proof that a potential breakthrough into the wellness market had the opportunity to be profitable. As seen in figure 1.1, provided by Grandview Research, shows an estimation of growth for the wellness market in the United States for years to come. It also includes relevant data points for SereniTea which would be “nutrition & weight management” as well as “stress management”. While others might see this information and be discouraged by the large amount of money already invested in the wellness industry, the group saw this information as proof there would be a market for the service SereniTea would be providing.

The next step was to figure out who SereniTea should be targeting. This is an important part of creating a business, as people are vastly different. In order to maximize the amount of customers, the creation and advertising of the business must be tailored to the target market.

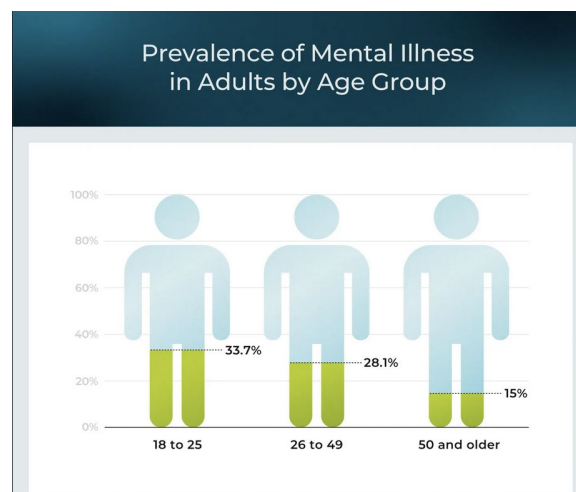

Figure 1.2

Figure 1.2 provides relevant information as to what group of people most suffers from mental illness. This is relevant to SereniTea because the main goal is to create a space centered

around being aware of these issues in people, and attempting to be as accommodating to them as possible. From the figure it became clear that the relevant age for SereniTea would fall between the ages of 18-49, as they are the group of people who are mostly impacted with mental illness.

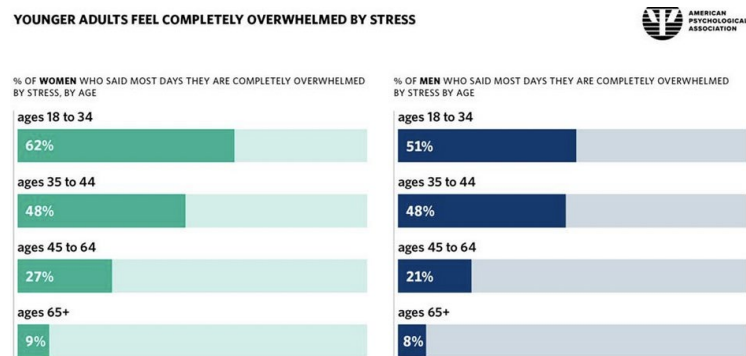

Figure 1.3

Figure 1.3 further confirms the findings from Figure 1.2. This is a similar graphic, but includes adults who feel stress instead of showing mental illness. People who feel stressed was an important data point for SereniTea because of the overall nature of creating a stress-free environment for our customers. These percentages clearly show that there is an extremely large part of the population that feels stressed, and furthermore strengthened the thought process of tailoring the shop toward adults between the ages of 18-49. With this in mind, the next step was to figure out the layout of the cafe.

The group felt strongly that the most important part of the layout was going to be making sure the ambiance was perfectly calming. The most important aspect to a relaxing atmosphere began with lighting. Lighting has the potential to instantly either relax someone, or put them on edge. This isn't something that is extremely obvious, but there is a clear importance if one imagines themselves in different situations. For a relaxing tone, the group decided natural lighting would be best. Sunlight is also very important for overall mood-boosting so this was a no-

brainer. When the sun goes down, the cafe will be using dim lighting as well. Bright lights can come off as intimidating and intense, which would be completely against the mission of the cafe. The color palette of the cafe was also extremely important. According to Paper Heart Design Co. “Green is classically known as a comforting harmonious color.”

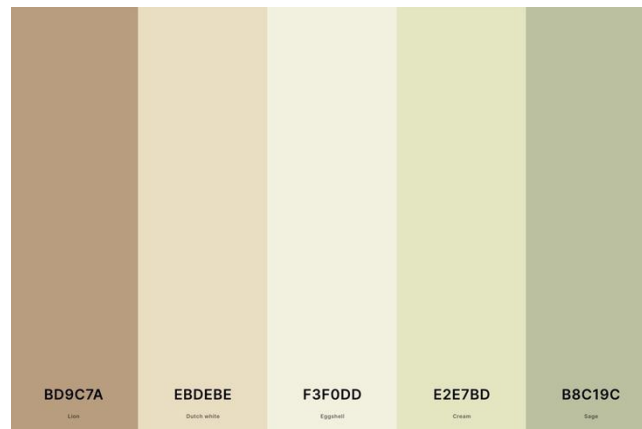

Figure 1.4

Figure 1.4 shows a sample of the color schemes SereniTea will incorporate into the business. This will allow for maximum relaxation, avoiding the intense feeling that can come from bright colors.

Overall, SereniTea will be focusing on the wellness aspect of the business to stand out from the competition. A space of complete relaxation where any individual can show up to and release any pent up tension or anger from a long week of work, or just for a relaxing evening. With an inviting staff, calm ambiance, and healthy food SereniTea should be in a great position to attract guests day in and day out. It will not only look to be a totally serene experience for the customers, but it will also be a place where someone can go to receive an extremely high quality meal or refreshments with substantial health.

Strategic Advice

The article that was chosen in order to give strategic advice was “What is a business Model” by Francine Newth. In the article, Newth gives profound insight into the aspects of creating a business model. She explains how important the value proposition, strategic resources, and dynamic processes are. By examining SereniTea’s value proposition, strategic resources, and dynamic processes, conclusions can be made as to whether or not it can create and maintain an advantage within the wellness market.

Starting with the value proposition, Newth elaborates by explaining that the value proposition is an idea that fills a gap or satisfies a customer want that isn’t currently being satisfied. She further explains that a good value proposition helps capture its audience either by providing the same value at a lesser price, or by providing more value at a higher price. She overall summarizes it by saying that this should ultimately be why someone should buy from you rather than from a competitor. Applying this logic to SereniTea, the value proposition would include many of the things that have already been stated earlier. SereniTea truly differentiates itself from chain and other local coffee shops because of the fact that it is the ultimate relaxation zone that is focused on the wellness of its customer. The cafe also provides mood-boosting food/drink, healthy recipes, and therapy dogs walking around the premises for any customer who would enjoy the company of a dog. The shop will be decorated to the brim with calming photos, relaxing aromas, and comfortable seating. Customers will be willing to pay a premium because SereniTea will be providing more value than the regular coffee shop. People don’t go to Starbucks wanting to relax, people go to Starbucks because they want a quick cup of coffee. Customers going to SereniTea will experience the complete opposite. It will truly feel more like

an event when going to SereniTea. It will be going to a safe and relaxing space rather than just going out for a regular cup of coffee.

Moving into the strategic resources. Strategic resources are detailed by Newth in the article as being the assets that the business owns that will help create value and execute the value proposition. For SereniTea, one of the main strategic resources will be the location of the initial coffee shop. The plan is for SereniTea to be located in an urban area, specifically in Chicago. The ideal location would be in a trendy neighborhood such as Wicker Park or Lincoln Park. This would be ideal because it provides easy access for any potential customer wanting to try out the wellness experience. It makes it easier than if the shop was located outside of the city because people would need to go out of their way to visit. By being located in a busy area, people would be able to stop by after work and SereniTea would be the perfect place for them to relax from a long day at work. Another strategic resource would be the overall culture of the business. It would be difficult for another company to attempt to recreate the level of wellness centered culture that SereniTea will build. Not only with the ambiance, but the staff will be trained extensively to actively participate with the customers and actively make customers want to be in the building. This will ultimately lead to a sense of community for regular customers within the building. Finally, SereniTea will partner with local farmers in order to create an extra level of trust and support with the customers. All three of these resources will play a big factor in creating customer loyalty, as well as becoming a completely unique entity among coffee shops. Newth explains how the strategic resources should tie back and align with the value proposition, and SereniTea will surely be tough to get copied, as the wellness idea is the entire reason for existence.

Lastly, moving into dynamic processes. Newth explains dynamic processes as processes that the company will be able to focus on that will transform the strategic resources into what the company really does. SereniTea will smartly take the sense of community that it will build and use it to further improve the company. An example would be requesting surveys from regulars at the establishment for some foods that they would like to see become integrated into the menu. This would be an intelligent move because not only is SereniTea making sure their customers are buying food, but they will further make the customer feel like they are a part of the team. This will also be partnered with a loyalty rewards program that will incentivize people to spend money at the cafe for free rewards. This will only further strengthen the loyalty, ensuring that these customers will keep coming back for more. Another dynamic process would be renting out the facility to groups who will be willing to pay a certain amount for a certain amount of time. This will only further increase revenue for the business. Not only that, but If a book club, poem reading club, or any other group wants to host their events at SereniTea, it will only further help with the exposure of the brand. More people will be exposed to the coffee shop and awareness will increase over time.

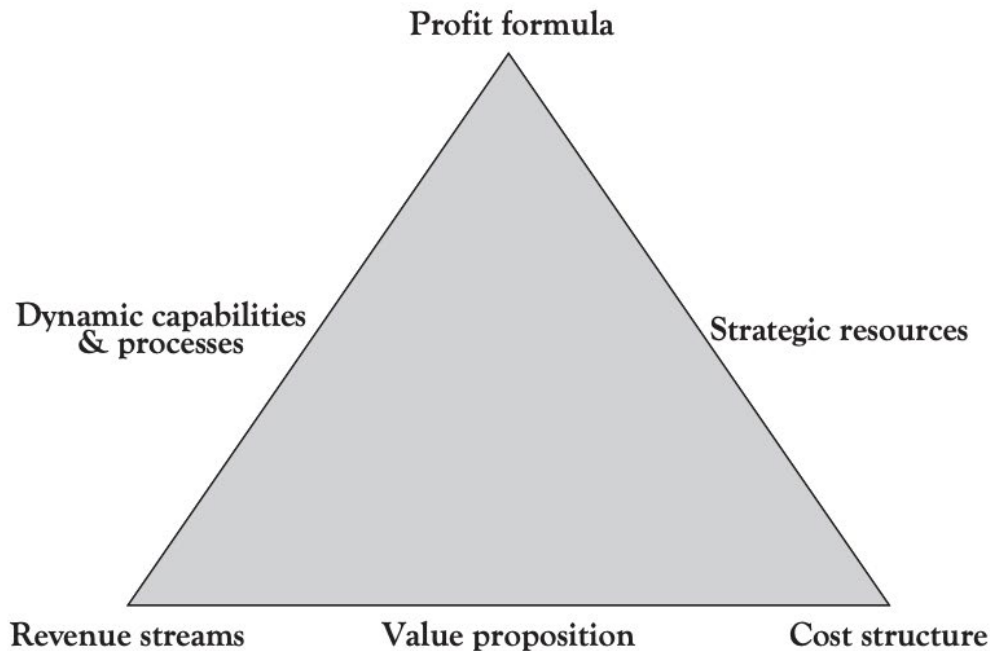

Figure 1.5 shows the structure of the business model created by Francine Newth

Additional Research

Still using the article “What is a business model?” by Francine Newth, the additional research was done around the financial aspects of SereniTea. Newth explains how financial viability is the most crucial aspect of the business model. If a company is found to not be financially viable, then it isn’t a business worth digging deeper into. SereniTea will be operating within an industry that historically has very small margins. A deeper look at the financial viability of the revenue streams, cost structure, and the overall profitability outlook of the business will be necessary for sufficient financial analysis. This will need to be done based on assumptions, as there isn’t any business out there that will be providing the same quality services that SereniTea plans to provide.

SereniTea is first and foremost a coffee shop. This means that most of the income will be generated from sales of food and drink. The coffee shop would clearly be a part of the service industry, providing customers service, food, and drink. According to an article written by Jordan

Rosenfeld from Yahoo Finance, people spend an average of \$12-\$15 when going out to a coffee shop. They specifically mention that these figures come from the average visit at a chain coffee shop. Couple this statistic with another important statistic coming from a website named Coffee Geek, which states that “When it comes to independent coffee shops, they typically serve around 200-300 customers per day”. These are important figures to note because they give a base for which SereniTea can make assumptions about their revenue figures.

Customers	200
\$ Spent Per Customer	\$12
Daily Revenue	\$2,400
Monthly Revenue	\$72,000

Figure 1.6

Figure 1.6 clearly shows the estimated amount of monthly revenue using the worst case scenario for the amount of average customers a month, and amount spent per customer based on the averages from the research extracted from the Yahoo Finance and Coffee Geek articles listed previously.

Of course there will be variability, and since SereniTea will be more of a specialty coffee shop, the average prices for the food and drink will be higher. However without a full working menu, the average figures from above will work for now. The assumption for the amount of customers per day is also a bit vague, as it doesn't list variability between seasons, weekdays vs weekends, or location, but there isn't any more concrete information over this unfortunately.

Although most of the revenue will be coming in from food and drink, the issue with this is that

historically, the food industry has very small margins due to the fact that there is a lot of waste, high competition, and high operating costs. All of these factors can make or break a business within the first couple of years if the business isn't able to make a name for itself quickly. Due to the fact that SereniTea will be using quality, natural ingredients, it will definitely be exposed to the same level of waste that other restaurants face. This is why something that SereniTea might look into in the future is to involve some product based sales as well. Generally speaking, most people that go to niche coffee shops usually are there because they enjoy the aesthetic of locally owned coffee shops. This also normally leads to people who appreciate uniqueness, and certainly one who might enjoy certain knick knacks from their favorite coffee shop. This is where SereniTea might be able to capitalize and bring in extra revenue. It could be a good idea to implement some products like coffee mugs, stickers, t-shirts, or any other merchandise that the average customer might find enjoyable to purchase. This would increase the amount of profit that the coffee shop would be bringing in, but the timing of it must be strategic. If product based revenue is attempted too early, as in before SereniTea is established, it could potentially lead to merchandise sitting on the shelf for too long due to lack of a large enough loyal customer base.

As for the costs of SereniTea, there will be, as in every business, some upfront costs, monthly fixed costs, and monthly variable costs. The upfront costs will be extremely pricey as they would be for any business starting from the ground up. These calculations will be done using assumptions. Large amounts of money will need to go toward buying equipment for the kitchen and the coffee systems. Since SereniTea's DNA will be creating a serene environment, a large sum of money will need to be invested in furniture as well. Adding on to the would be the point of sale system, any food handling legal fees, and logos or signs for the business as well. The fixed costs would also be fairly high every month, specifically because it will be based out

of Chicago, in a trendy neighborhood. The rent in a good and popular location with ample amounts of space as SereniTea is looking for will cost in the neighborhood of \$10,000 a month. Couple this with the wages per month, insurance, and subscriptions to softwares for internal business and the fixed costs come out to about \$29,000. For variable costs, as mentioned previously, food supplies will be the biggest cost due to the fact that the shop will be using only fresh and natural ingredients. This will come out to an estimated \$10,000 a month, along with any consumables like napkins, cups, utensils, and cleaning supplies. Also add in around \$1,000 a month for advertising and this comes out to \$12,000. A simplified version of these calculations is shown below in figure 1.6.

Upfront Costs	Estimation	Monthly Fixed Costs	Estimation	Monthly Variable Costs	Estimation
Furniture	\$60,000	Rent	\$10,000	Food Supplies	\$10,000
Kitchen Equipment	40,000	Wages	\$16,000	Cups, Napkins, Cleaning Supplies	\$1,000
Coffee Equipment	\$40,000	Utilities	\$2,000	Advertising	\$1,000
POS System	\$5,000	Insurance	\$1,000		
Legal Fees	\$3,000	Subscriptions	\$200		
Logos	\$3,000				
Total	\$151,000	Total	\$29,200	Total	\$12,000
Total Upfront Costs		Total Monthly Costs			
\$151,000		\$41,200			

Figure 1.6

In order to do the profitability analysis, the worst case scenario for the assumptions listed above in the revenue section and the costs section will be used, along with a 30 day month. Doing the simple math of subtracting the estimated monthly revenue of \$72,000 and the estimated monthly costs of \$41,200, one can conclude that SereniTea has the potential to be profitable. The monthly profit comes out to about \$30,800. Doing more simple math, taking the profit per month and dividing it by the total monthly revenue, one gets a total profit margin of 42.8%. Of course, this is all based on assumptions and estimations, so these numbers may seem

extremely large in comparison to what it might be in actuality, but overall things seem like they could work for the coffee shop. SereniTea would also be charging more for food and drink since they will be all natural, so the monthly revenue could be well below what the shop might be able to bring in.

Conclusion

In conclusion, SereniTea is a wellness centered coffee shop that wants to pride itself in making sure they are taking care of their customers first. There are many things that make SereniTea unique, including the food and drink selection, relaxing atmosphere, friendly staff, and overall comfortable atmosphere. All of these things can potentially cultivate a business that will be able to succeed in the long run by creating long term relationships with its customer base through quality service.

Aligning Technology Adoption with Organizational Culture through Hawkeye Security

Product & Service Description

Introduction to Hawkeye Security

Hawkeye Security is an integrated security system that combines surveillance cameras, mobile devices, applications, and centralized monitoring. We incorporate cloud-based technology that utilizes real-time alerts with a mobile interface. This interface and approach work to provide faster and more reliable security for organizations. Our smart security solution is designed to give organizations prompt security communication with instant visuals and AI integration to help notify users of activity.

Hawkeye Security has an infrastructure that is both modular and scalable, making this the correct choice for both university campuses and local organizations. It doesn't stop there— we believe this can be useful for any group of individuals. We want to apply our product to event spaces and industrial facilities so that everyone can feel safe, despite what kind of facility they are in. Additionally, we are bigger than recording and reporting incidents; this product empowers users to collaborate and act swiftly, leading to an empowering feeling that users can

identify with as we deliver regional safety by delivering situational awareness directly to the application.

Problem It Solves

Our product works to solve issues that are specific to college campuses, but can be utilized beyond this. At Illinois Tech, there is a lack of awareness in campus parking lots as lighting is little to none. On top of this, students and faculty take and teach night courses. This begins the problem that needs a solution: how can we make stakeholders safer? We decided that implementing an application that incorporates night vision cameras with real-time alerts and response could be something to solve this issue. Our application will also include a chat room where individuals can communicate and discuss what's occurring so that all can benefit from this sense of community.

Intended Users

Despite it being developed to solve the issue of campus safety, our product can be used by any organization. Municipal governments, large private facilities, security departments, and even contractors could benefit from this product. Our team has thought that a good partnership could be with local police departments. This could lead to more effective response times to incidents and better protection overall.

Design Process

When looking at the design process for Hawkeye security, we utilized the 10-step framework to help solidify and develop it.

Opportunity Identification

Overall, there is a rising demand for safe and more effective security. Smart regional security is the perfect opportunity to tap into. With this in mind, our product aligns with what customers need.

Customer Needs Identification

Today's customers want speed, ease of use, and unobstructed integration. They want to monitor areas remotely, receive instant alerts, and integrate security devices into a single hub. Hawkeye Security was constructed on these lines. Its features—mobile support, central monitoring, and real-time data integration—are specifically crafted to address the requirements of today's users from across sectors.

Concept Generation

Next, for concept generation, we brainstormed features such as mobile alerts and cloud video. We also wanted this to be a product that lasts outside and maintains energy so that it's reliable but still eco-friendly. We thought a way to target all of this is by using solar power to run the energy of the cameras with backup batteries and generators in case it dies.

Concept Selection

We then developed a simplified concept of the concept selection. We centralized an idea of the dashboard on the application and how both a camera and a phone would be needed to integrate these concepts.

Product Architecture

We also considered the architecture of the product itself. There is a need for both hardware and software layers to make this fully functional. We would incorporate both of these with reliable software backgrounds so that the application and cameras can be fun seamlessly and be fully functional.

Industrial Design

For the design of the product, we want the interface of the application to be user-friendly with visual alerts. We would incorporate a chat room section so that individuals can discuss concerns, safety tips, and other information with a community.

Prototyping

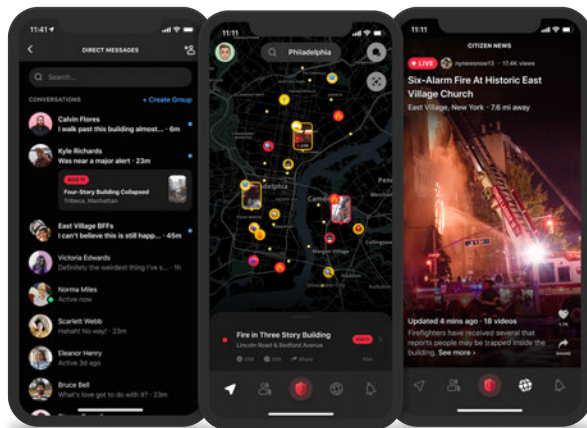

The physical aspect of our product is going to look similar to what a ring camera looks like. Ring offers larger surveillance cameras, and these would be used to survey areas. They would have a solar panel attached to it so it can collect and disperse energy when necessary. There would be backup energy attached so that when the solar energy is not available, the

backup energy can be utilized. Additionally, the phone application would look very similar to the Citizens app. Design would be different, but overall, the functionality would be similar.

Solar Panel Ring Design

Citizen App Interface:

Ring Camera (Commercial Grade Style)

Testing & Feedback

There are many ways we could gather feedback on our product. We could do testing through a pilot program for mid-sized campuses and small towns— event parks. Through this, we can test our core features like camera connectivity, real-time alert to mobile devices, and user access to the application dashboard. We could connect qualitative and quantitative feedback with solid questions like: How easy was it to use? Were alerts received in time? We're users confident in the system? Additionally, when gathering feedback that was from classmates and

acquaintances, individuals voiced their concerns, allowing us to improve the security system based on each concern.

Product Improvement and Scaling

This step is built on all the previous ones and gives us a chance to take everything we've learned to improve our product and plan how to expand it to new users and markets. Based on our feedback, we have found that it would be beneficial to refine features by streamlining our mobile user interface and improving latency on alert notifications. We would also add user support onboarding steps so that we can constantly improve our team, but make it easier. We also found that it could be beneficial to prepare packages as we consider scaling. Packages can be positive to target different markets, such as a school vs. a city, vs. a private company. Each respective package would have different amounts of suggested cameras and functionality access to each application. With scaling in mind, we also must ensure cloud infrastructure is capable of growth and constant storage. Lastly, we should identify hardware vendors and distribution partners so that scaling becomes easier, as growth would streamline installation.

Strategic Recommendations Based on Research

Based on these two studies, the following strategies are recommended to strengthen the business case for Hawkeye Security:

1.) Promote Cultural Alignment as Part of Deployment Strategy

Clients that want to implement Hawkeye Security should assess how their internal culture is functioning so that they can identify barriers (i.e., cliques)

teams, resistance to change). A cultural overview before implementation can be part of the onboarding process.

2.) Develop structured Onboarding and Training Styles

Training should be ongoing and not a one-time thing. Ongoing support, learning resources, and frequent check-ins can ensure users stay confident and engaged with Hawkeye Security.

3.) Facilitate Cross-Functional Collaboration

Encourage frequent and regular communication between all teams (security, IT, operations) to reduce miscommunication. This can overall improve speed and align daily goals and practices with what Hawkeye Security identifies with.

4.) Reframe the Business Case Beyond Cost Identifies

Understandably, businesses focus mainly on the cost of features, but ultimately, there should be a consideration of how the company will take the change rather than the cost. Beyond how a company adjusts, other things should be considered, such as long-term integration and higher usage rates, both important when considering ROI.

Strategic Advice

Article Summary

For this section, I referenced "What Is an Organization's Culture?" by Clayton Christensen, published in the Harvard Business Review. Christensen argues in the article that organizational culture is more than a list of values — it's a pattern of shared thought and action developed over time by people solving problems together. He emphasizes that culture plays a critical role in how organizations respond to new technology. It does not matter whether the technology is first-rate; adoption will fail if the culture resists it. On the other hand, companies with open, adaptive cultures are more likely to embrace innovation and install new systems successfully.

Key Insight

One of the most significant concepts in this article is that technology adoption is never simply a matter of installing a new system — it's a matter of how people act, communicate, and work together. Organizations that foster innovation, take risks, and invest in employee growth are more effective at adopting new tools. Those with stodgy hierarchies and fear-based cultures, on the other hand, tend to lag, not due to inferior products, but due to internal resistance. This is particularly relevant for firms that are launching complex technologies based on everyday use, group coordination, and real-time decision-making.

Application to Hawkeye Security

Hawkeye Security is an area surveillance network that combines cameras, mobiles, and monitoring centralization. Its success isn't dependent solely on the software or hardware, but on whether people trust it and utilize it on a routine basis. With Christensen's model, multiple strategic steps are critical to good implementation:

1.) Build a Culture of Openness to Innovation

Organizations must establish an atmosphere within which embracing new technology is viewed as a worthwhile endeavor. This can be facilitated through internal messaging, public leadership endorsement, and positive feedback in early utilization.

2.) Leadership Needs to Be an Active Sponsor of the System

There needs to be more than mere approval of Hawkeye by top leaders — they must actively champion its significance, provide time and resources for its implementation, and clearly articulate its value to departments.

3.) Encourage Cross-Department Cooperation

Hawkeye will involve IT personnel, security officers, and operations staff. Coordination between these groups must be designed from the beginning to prevent siloed thinking and facilitate smooth integration.

4.) Prioritize Trust and Training

Adoption over the long term of Hawkeye depends on trust. That means offering extensive training, providing timely technical support, and making employees feel at ease, not threatened, by the system.

Conclusion

Christensen's article introduces the reality that culture is not separate from strategy — culture is strategy. For Hawkeye Security to be successful, organizations must map internal culture to the goals of the technology. That means preparing people, not simply software installation. Where there is trust, leadership, and communication, tech adoption isn't just possible, but powerful.

Additional Research

Research Focus

I used additional research to find out how organizational culture is involved in the implementation and success of new technologies, emphasizing how this could apply to our product, Hawkeye Security. To support this analysis, I cited two studies that examine the intersection of culture, digital transformation, and the long-term fate of innovation. These studies indicate that even the best-designed technology will not work as well in non-collaborative or change-resistant environments. This perspective adds richness to our business case, where Hawkeye Security is not just a technical solution, but a product requiring a high cultural fit within client organizations to achieve its full value.

Source 1: Organizational Culture and Its Impact on Technology Adoption and Business

Agility by Moses Alabi (2025)

Key Findings:

This study emphasizes that companies possessing adaptive, innovation-driven cultures have a greater possibility of gaining a competitive advantage and ensuring growth in the context of fast-changing business environments. This study accentuates the importance of alignment of corporate culture with digital transformation initiatives for better organizational agility, responsiveness, and long-term success. Companies that build adaptability into their culture are more open to change and fully harness new technologies.

Implications for Hawkeye Security:

For Hawkeye Security to be effectively adopted, organizations must have an innovative and agile culture. Teams must be open to adopting new processes and systems. This means leadership must promote experimentation, decrease fear of failure, and create a culture where feedback is encouraged. By promoting these values within the organizational culture, organizations can reduce resistance and maximize buy-in for security technologies like Hawkeye Security.

Source 2: Organizational Culture, Digital Transformation, and Product Innovation by Alalwan, A. A., Dwivedi, Y. K., & Rana, N. P. (2021)

Key Findings:

This study concludes that clan cultures — firms that emphasize teamwork, employee development, shared values, and trust — are optimally positioned to spearhead effective digital transformation. These cultures establish an environment in which employees are supported and engaged, significantly contributing to the adoption and long-term success of new technology.

The study further concludes that collaborative, people-oriented atmospheres will tend to outcompete bureaucratic or siloed organizations when it comes to implementing new systems.

Implications for Hawkeye Security:

Companies deploying Hawkeye Security must prioritize the cultivation or strengthening of team-oriented, participative cultures as their priority. When employees are empowered, motivated, and integrated into a wider purpose, they are more accepting of learning new systems and their implementation. Providing incentives for departments to collaborate on the inside, as well as investing in robust training, will make the switch easier. This way will result in increased system use, lowered resistance, and higher long-term satisfaction with the platform, guaranteeing Hawkeye Security achieves its complete strategic benefit.

Conclusion

This research further supports that Hawkeye Security is not merely a technology purchase — it's a shift in the way an organization thinks about, talks about, and responds to its physical environment. Culture and technology are inseparable, and businesses that understand this marriage will be better positioned to take advantage of the ultimate value from convergent security systems. Through consolidating insights from these studies, we can better guide clients towards the adoption not only of Hawkeye Security but also in turning it into a holistic, integrated part of their company.

The following pages contain an artifact sample for **Goal 3 Analytic Skills**.

1. See on Excel Sheet. The optimal solution is \$1,304,378.
2. In order to improve the solution Rick would need to produce more aluminum and rock maple. This is visible by looking at the fact that we are using all of these resources of aluminum in Daytona and Memphis, and we are using all of the rock maple in Tempe.
3. They're profit would be \$1,349,340.
4. The pro would be that the company would make around \$25,589 more. With a \$10,000 penalty, the company would make \$15,589 more in profit over the original solution. The con would be that we would be working in bad faith with the distributor and they might not want to keep doing business with us.
